

## CQ50 Power Sequencer

The new CQ50 is a convenient power control module that plugs into a wall outlet and integrates with other CQ Series devices. Two AC receptacles turn on in one sequence step. A third, unswitched, outlet is available to power equipment that needs to stay on all the time.

By regulation, the fifteen amp circuit breaker is derated to twelve amps.

### CQ50 vs CQ5

As a replacement for the popular CQ5, the CQ50 reduces cost and increases product availability by incorporating more of the reliable and economical components used for decades in other CQ Series models.

**The CQ50 has the same basic features as the CQ5, a convenient, plug-in sequencer for non rack mounted applications. Both 15 amp units integrate with other CQ Series products using Juice Goose analog networking protocol.**

Main product differences:

- Slightly larger chassis (1.75H x 8.5W x 9.5D)
- AC outlets on side rather than top
- One unswitched outlet
- Replaceable power cord
